Package 'PerMallows'

April 28, 2017

Type Package

Title Permutations and Mallows Distributions

Version 1.13
Date 2017-04-28
Author Ekhine Irurozki <ekhine.irurozqui@ehu.eus>, Borja Calvo</ekhine.irurozqui@ehu.eus>
<pre><borja.calvo@ehu.eus>, Jose A. Lozano <ja.lozano@ehu.eus></ja.lozano@ehu.eus></borja.calvo@ehu.eus></pre>
Maintainer Ekhine Irurozki <ekhine.irurozqui@ehu.eus></ekhine.irurozqui@ehu.eus>
Description Includes functions to work with the Mallows and Generalized Mallows Models. The considered distances are Kendall's-tau, Cayley, Hamming and Ulam and it includes functions for making inference, sampling and learning such distributions, some of which are novel in the literature. As a by-product, PerMallows also includes operations for permutations, paying special attention to those related with the Kendall's-tau, Cayley, Ulam and Hamming distances. It is also possible to generate random permutations at a given distance, or with a given number of inversions, or cycles, or fixed points or even with a given length on LIS (longest increasing subsequence).

compose

Index

Compose permutations

Description

This function composes two given permutations. One of the arguments can be a collection of permutations, but not both at the same time. In this case, every permutation in the collection is composed with the other argument

24

Usage

```
compose(perm1, perm2)
```

Arguments

perm1 a permtuation or a collection of permutations perm2 a permtuation or a collection of permutations

Value

The composition of the permutations

```
compose(c(3,1,2,4), c(4,1,3,2))
```

count.perms 3

count.perms	Count permutations at a distance	
-------------	----------------------------------	--

Description

Given a distance (kendall, cayley, hamming or ulam), the number of items in the permutations perm.length and distance value d, how many permutations are there at distance d from any permutation? It can be used to count the number of derangements and the permutations with k cycles (Stirling numbers of the first kind)

Usage

```
count.perms(perm.length, dist.value, dist.name = "kendall", disk = FALSE)
```

Arguments

perm.length number of items in the permutations

dist.value the distance

dist.name optional. One of: kendall (default), cayley, hamming, ulam

optional can only be true if counting the permutations at each Ulam distance. Insted of generating the whole set of SYT and count of permutations per distance, it loads the info from a file in the disk

Value

The number of permutations at the given distance

Examples

```
count.perms(4,2,"kendall")
count.perms(4,2,"ulam")
count.perms(4,2,"hamming")
count.perms(4,2,"cayley")
# The number of derangements of length 6 is computed as follows
len <- 6
count.perms(perm.length = len, dist.value = len, dist.name = "h")
# The number of permutations with one cycle is computed as follows
num.cycles <- 1
count.perms(perm.length = len, dist.value = len - num.cycles, dist.name = "c")</pre>
```

cycle2str

Friendly display the cycles

Description

Given a list with the cycles of a permutation, displays them in the standard cycle notation

Usage

```
cycle2str(cy)
```

4 data.order

Arguments

су

a list with the set of cycles

Examples

```
cycle2str(perm2cycles(c(1,5,2,3,4)))
```

cycles2perm

Get the permutation given the cycles

Description

Get the permutation as a vector given the set of cycles in which it factorizes

Usage

```
cycles2perm(cycles)
```

Arguments

cycles

a list with the set of disjoint cycles

Value

The permutation in vector notation

Examples

```
cycles2perm(perm2cycles(c(1,5,2,3,4)))
```

data.apa

Sample of permutations APA

Description

A rda file containing a sample of permutations of the American Psychology Association

Format

Each row is a permtuation

data.order

Sample of permutations

Description

A rda file containing a sample of permutations

Format

Each row is a permtuation

decomp2perm 5

decomp2perm Get a permutation consistent with a decomposition vector
--

Description

Given a distance decomposition vector and a distance name, generate uniformly at random a permutation consistent with the decomposition vector.

Usage

```
decomp2perm(vec, dist.name = "kendall")
```

Arguments

vec the permutation

dist.name optional the name of the distance. One of: kendall (default), cayley, hamming

Value

The distance decomposition vector of the given permutation and distance

Examples

```
decomp2perm(c(1,0,1,0,0), "kendall")
decomp2perm(c(1,0,1,0,0), "cayley")
decomp2perm(c(1,0,1,0,0), "hamming")
```

dgmm

Calculate the probability of a permutation in a GMM

Description

Calculate the probability of a permutation sigma in a GMM of center sigma0, dispersion parameter theta and under the specified distance

Usage

```
dgmm(perm, sigma0 = identity.permutation(length(perm)), theta,
  dist.name = "kendall")
```

Arguments

perm permutation whose probability wants to be known sigma0 central permuation of the GMM, by default the identity

theta vector dispersion parameter of the GMM

dist.name optional name of the distance used in the GMM. One of: kendall (default), cay-

ley, hamming

6 distance

Value

The probability of sigma in the given GMM

Examples

```
data <- matrix(c(1,2,3,4, 1,4,3,2, 1,2,4,3), nrow = 3, ncol = 4, byrow = TRUE) sig <- c(1,2,3,4) th <- c(0.1, 0.2, 0.3,1) log.prob <- apply(data,MARGIN=1,FUN=function(x){log(dgmm(x,sig, th, "hamming"))}) sum(log.prob) dgmm (c(1,2,3,4), theta=c(1,1,1)) dgmm (c(1,2,3,4), theta=c(1,1,1), dist.name="cayley")
```

distance

Compute the distance between permutations

Description

Compute the distance between two given permutations. If only one permutation is given the other one is assumed to be the identity (1,2,3,....,n) The distance can be kendall, cayley, hamming and ulam

Usage

```
distance(perm1, perm2 = identity.permutation(length(perm1)),
   dist.name = "kendall")
```

Arguments

perm1 a permutation
perm2 optional a permutation

dist.name optional. One of: kendall (default), cayley, hamming, ulam

Value

The distance between the permutations

```
distance(c(1,2,3,5,4))
distance(c(1,2,3,5,4), c(1,2,3,5,4))
distance(c(1,2,3,5,4), c(1,4,2,3,5), "cayley")
```

dmm 7

dmm

Calculate the probability of a permutation in a MM

Description

Calculate the probability of a permutation sigma in a MM of center sigma0, dispersion parameter theta and under the specified distance

Usage

```
dmm(perm, sigma0 = identity.permutation(length(perm)), theta,
  dist.name = "kendall")
```

Arguments

perm permutation whose probability is asked for

sigma0 optional central permuation of the MM, by default the identity

theta dispersion parameter of the MM

dist.name optional name of the distance used in the MM. One of: kendall (default), cayley,

hamming, ulam

Value

The probability of sigma in the given MM

Examples

expectation.gmm

Compute the expected distance, GMM under the Hamming distance

Description

Compute the expected distance in the GMM under the Hamming distance

Usage

```
expectation.gmm(theta, dist.name = "kendall")
```

8 expectation.mm

Arguments

theta n dimensional real vector with the dispersion parameters

dist.name optional name of the distance used in the GMM. One of: kendall (default), cay-

ley, hamming

Value

The expected distance decomposition vector under the GMM

References

"Ekhine Irurozki, Borja Calvo, Jose A. Lozano (2016). PerMallows: An R Package for Mallows and Generalized Mallows Models. Journal of Statistical Software, 71(12), 1-30. doi:10.18637/jss.v071.i12"

Examples

```
expectation.gmm(c(0.38, 0.44, 0.1, 0.2, 1, 0.1)) expectation.gmm(c(2, 2, 2, 2),"cayley") expectation.gmm(c(0.3, 0.1, 0.5, 0.1),"hamming")
```

expectation.mm

Compute the expected distance, MM under the Hamming distance

Description

Compute the expected distance in the MM under the Hamming distance

Usage

```
expectation.mm(theta, perm.length, dist.name = "kendall")
```

Arguments

theta real dispersion parameter

perm.length length of the permutation in the considered model

dist.name optional name of the distance used in the MM. One of: kendall (default), cayley,

hamming, ulam

Value

The expected distance under the MM

References

"Ekhine Irurozki, Borja Calvo, Jose A. Lozano (2016). PerMallows: An R Package for Mallows and Generalized Mallows Models. Journal of Statistical Software, 71(12), 1-30. doi:10.18637/jss.v071.i12"

```
expectation.mm( 1, 7, "kendall" )
expectation.mm( 2, 5, "cayley" )
expectation.mm( 2, 4, "hamming" )
expectation.mm( 1, 6, "ulam" )
```

freq.matrix 9

freq.matrix

Compute the frequency matrix

Description

Compute the first order marginal probability. In other words, given at least one permutation, calculate the proportion of them that have each item in each position

Usage

```
freq.matrix(perm)
```

Arguments

perm

a permutation or a collection of them

Value

A matrix with n rows and n columns with the proportion of the permutations in the input that have each item in each position

Examples

```
freq.matrix(c(1,3,2,4,5))
```

generate.aux.files

Generates the files for Ulam

Description

Generates files for Ulam which are aimed to accelelrate the processes of counting the number of permutations at ech distance, sampling and learning IFF these operations are going to be computted more than once

Usage

```
generate.aux.files(perm.length)
```

Arguments

perm.length number of items in the permutations

Value

Nothing. Only writes in the current folder the axiliary files

```
generate.aux.files(4)
```

insert insert

identity.permutation Generate identity the permutation

Description

This function generates the identity permutation of a given number of items

Usage

```
identity.permutation(perm.length)
```

Arguments

```
perm.length number of items in the permutation
```

Value

The identity permutation of the specified number of items

Examples

```
identity.permutation(3)
identity.permutation(7)
```

insert

Insert operator

Description

Given a permutation and two positions i, j, move item in position i to position j

Usage

```
insert(perm, i, j)
```

Arguments

perm	a permutation
i	position of the permutation
j	position of the permutation

Value

The permutation in the input in which th eoperation has been applied

```
insert(c(1,2,3,4,5),5,2)
insert(c(1,2,3,4,5),2,5)
```

inverse.perm 11

inverse.perm

Generate inverse permutation

Description

This function generates the inverse of a given permutation. If the input is a matrix of permutations, invert all the permutations in the input.

Usage

```
inverse.perm(perm)
```

Arguments

perm

a permutation or matrix of permutations

Value

The inverse permutation. If the input is a matrix, the matrix with the inverses

Examples

```
inverse.perm(c(1,2,3,4)) inverse.perm(c(2,3,4,1)) data <- matrix(c(1,2,3,4,1,4,3,2,1,2,4,3), nrow = 3, ncol = 4, byrow = TRUE) inverse.perm(data)
```

inversion

Inversion operator

Description

Given a permutation and a position, swap positions i and i+1

Usage

```
inversion(perm, i)
```

Arguments

```
perm a permutation
```

i position of the permutation

Value

The permutation in the input with an inversion at the specified position

```
inversion(c(1,2,3,4,5),2)
```

lgmm

is.permutation	Check if its argument is a permutation
----------------	--

Description

This function tests if the given argument is a permutation of the first n natural integers (excluding 0)

Usage

```
is.permutation(perm)
```

Arguments

perm a vector (or a bidimensional matrix)

Value

TRUE iff perm is a valid permutation (or a matrix of valid permutations)

Examples

```
is.permutation(c(3,1,2,4))
is.permutation(c(6,1,2,3))
is.permutation(matrix(c(1,2,3,4,1,4,3,2,1,2,4,3), nrow = 3, ncol = 4, byrow = TRUE))
```

1gmm

Learn a Generalized Mallows Model

Description

Learn the parameter of the distribution of a sample of n permutations comming from a Generalized Mallows Model (GMM).

Usage

```
lgmm(data, sigma_0_ini = identity.permutation(dim(data)[2]),
dist.name = "kendall", estimation = "approx")
```

Arguments

data	the matrix with the permutations to estimate
sigma_0_ini	optional the initial guess for the consensus permutation
dist.name	optional name of the distance used by the GMM. One of: kendall (default), cayley, hamming
estimation	optional select the approximated or the exact. One of: approx, exact

Igmm.theta

Value

A list with the parameters of the estimated distribution: the mode and the dispersion parameter vector

References

"Ekhine Irurozki, Borja Calvo, Jose A. Lozano (2016). PerMallows: An R Package for Mallows and Generalized Mallows Models. Journal of Statistical Software, 71(12), 1-30. doi:10.18637/jss.v071.i12"

Examples

```
data <- matrix(c(1,2,3,4, 1,4,3,2, 1,2,4,3), nrow = 3, ncol = 4, byrow = TRUE)
lgmm(data, dist.name="kendall", estimation="approx")
lgmm(data, dist.name="cayley", estimation="approx")
lgmm(data, dist.name="cayley", estimation="exact")
lgmm(data, dist.name="hamming", estimation="approx")</pre>
```

lgmm.theta

MLE for theta - Generalized Mallows Model

Description

Compute the MLE for the dispersion parameter (theta) given a sample of n permutations and a central permutation

Usage

```
lgmm.theta(data, sigma_0 = identity.permutation(dim(data)[2]),
  dist.name = "kendall")
```

Arguments

data the matrix with the permutations to estimate

sigma_0 optional the initial guess for the consensus permutation. If not given it is assumed to be the identity permutation

dist.name optional name of the distance used by the GMM. One of: kendall (default),

cayley, hamming

Value

The MLE for the dispersion parameter

```
data <- matrix(c(1,2,3,4, 1,4,3,2, 1,2,4,3), nrow = 3, ncol = 4, byrow = TRUE)
lgmm.theta(data, dist.name="kendall")
lgmm.theta(data, dist.name="cayley")
lgmm.theta(data, dist.name="cayley", sigma_0=c(1,4,3,2))
lgmm.theta(data, dist.name="hamming")</pre>
```

14 lmm

lmm	Learn a Mallows Model

Description

Learn the parameter of the distribution of a sample of n permutations comming from a Mallows Model (MM).

Usage

```
lmm(data, sigma_0_ini = identity.permutation(dim(data)[2]),
  dist.name = "kendall", estimation = "approx", disk = FALSE)
```

Arguments

data	the matrix with the permutations to estimate
sigma_0_ini	optional the initial guess for the consensus permutation
dist.name	optional the name of the distance used by the model. One of: kendall (default), cayley, hamming, ulam
estimation	optional select the approximated or the exact. One of: approx, exact
disk	optional can only be true if estimating a MM under the Ulam distance. Insted of generating the whole set of SYT and count of permutations per distance, it loads the info from a file in the disk

Value

A list with the parameters of the estimated distribution: the mode and the dispersion parameter

References

"Ekhine Irurozki, Borja Calvo, Jose A. Lozano (2016). PerMallows: An R Package for Mallows and Generalized Mallows Models. Journal of Statistical Software, 71(12), 1-30. doi:10.18637/jss.v071.i12"

```
data <- matrix(c(1,2,3,4, 1,4,3,2, 1,2,4,3), nrow = 3, ncol = 4, byrow = TRUE)
lmm(data, dist.name="kendall", estimation="approx")
lmm(data, dist.name="cayley", estimation="approx")
lmm(data, dist.name="cayley", estimation="exact")
lmm(data, dist.name="hamming", estimation="exact")
lmm(data, dist.name="ulam", estimation="approx")</pre>
```

Imm.theta 15

-							
1	mm	١.	t	n	е	Ť.	а

MLE for theta - Mallows Model

Description

Compute the MLE for the dispersion parameter (theta) given a sample of n permutations and a central permutation

Usage

```
lmm.theta(data, sigma_0 = identity.permutation(dim(data)[2]),
    dist.name = "kendall", disk = FALSE)
```

Arguments

data	the matrix with the permutations to estimate
sigma_0	optional the consensus permutation. If not given it is assumed to be the identity permutation
dist.name	optional the name of the distance used by the model. One of: kendall (default), cayley, hamming, ulam
disk	optional can only be true if estimating a MM under the Ulam distance. Insted of generating the whole set of SYT and count of permutations per distance, it loads the info from a file in the disk

Value

The MLE for the dispersion parameter

Examples

```
data <- matrix(c(1,2,3,4, 1,4,3,2, 1,2,4,3), nrow = 3, ncol = 4, byrow = TRUE)
lmm.theta(data, dist.name="kendall")
lmm.theta(data, dist.name="cayley")
lmm.theta(data, dist.name="cayley", sigma_0=c(1,4,3,2))
lmm.theta(data, dist.name="hamming")
lmm.theta(data, dist.name="ulam")</pre>
```

marginal

Compute the marginal probability, GMM under the Hamming distance

Description

Compute the marginal probability, GMM under the Hamming distance, of a distance decomposition vector for which some positions are known and some are not

Usage

```
marginal(h, theta)
```

16 maxi.dist

Arguments

h n dimensional distance decomposition vector where $h_j = 0$ means that j is a

fixed point, $h_j = 1$ means that i is an unfixed point and otherwise i is not

known

theta n dimensional distance decomposition vector with the dispersion parameters

Value

The marginal probability

References

"Ekhine Irurozki, Borja Calvo, Jose A. Lozano (2016). PerMallows: An R Package for Mallows and Generalized Mallows Models. Journal of Statistical Software, 71(12), 1-30. doi:10.18637/jss.v071.i12"

Examples

```
marginal(c(1,0,1,NA,NA), c(0.1, 0.3, 0.7, 0.1, 1))
marginal(c(NA,0,1,NA,NA,0), c(0.1, 0.3, 0.7, 0.1, 0.7, 1))
```

maxi.dist

Get the maximum value of the distance ebtween permutations

Description

Compute the maximum posible value for the distance between two given permutations. The distance can be kendall, cayley, hamming and ulam

Usage

```
maxi.dist(perm.length, dist.name = "kendall")
```

Arguments

perm.length number of items in the permutations

dist.name optional. One of: kendall (default), cayley, hamming, ulam

Value

The maximum value for the distance between the permutations

```
maxi.dist(4,"cayley")
maxi.dist(10,"ulam")
maxi.dist(4)
```

order.ratings 17

order.ratings

Convert rating to permutation

Description

This function is given a collection of ratings and converts each row to a permutation

Usage

```
order.ratings(ratings)
```

Arguments

ratings

a matrix in which each row is a vector of ratings of several items

Value

A matrix in which each row is the corresponding permutation of the items

Examples

```
order.ratings(c(0.1, 4, 0.5, -4))
```

perm.sample.med

Sample of permutations

Description

A rda file containing a sample of permutations

Format

Each row is a permtuation

perm.sample.small

Sample of permutations

Description

A rda file containing a sample of permutations

Format

Each row is a permtuation

18 perm2decomp

perm2cycles

Decompose a permutation in a set of cycles

Description

Factor a given a permutation in the set of independent cycles

Usage

```
perm2cycles(perm)
```

Arguments

perm

a permutation

Value

The permutation in the input in which the operation has been applied

Examples

```
perm2cycles(c(1,5,2,3,4))
```

perm2decomp

Get the decomposition vector

Description

Given a permutation and a distance name generate the decomposition vector

Usage

```
perm2decomp(perm, dist.name = "kendall")
```

Arguments

perm

the permutation

dist.name

optional the name of the distance. One of: kendall (default), cayley, hamming

Value

The distance decomposition vector of the given permutation and distance. For the Kendall distance is the inversion vector

```
perm2decomp(c(1,2,4,3,5), "kendall")
perm2decomp(c(1,2,4,3,5), "cayley")
perm2decomp(c(1,2,4,3,5), "hamming")
```

permutations.of 19

permutations.of Generate every permutation of perm.length item
--

Description

This functions returns a matrix in thich each of rows is a different permutation of the specified number of items

Usage

```
permutations.of(perm.length, alert = TRUE)
```

Arguments

perm.length number of items in the permutation

alert optional ask for confirmation when the number of permtuations to show is very

large

Value

A collection of every permutation of the specified number of items

Examples

```
permutations.of(3)
permutations.of(10)
```

rdist

Generate a collection of permutations at a given distance

Description

Given a number of permutations, the number of items in the permutations, a distance value and a distance name, generate a sample of permutations with the specified length at the given distance. Can be used to generate derangements and permutations of a given number of cycles

Usage

```
rdist(n, perm.length, dist.value, dist.name = "kendall")
```

Arguments

n number of permutations in the sample perm.length number of items in the permutations

dist.value distance value

distance name. One of: kendall (default), cayley, hamming, ulam

Value

A sample of permutations at the given distance

20 rgmm

Examples

```
rdist(1, 4, 2 )
rdist(1, 4, 2, "ulam")
len <- 3
rdist(n = 1, perm.length = len, dist.value = len, "h") #derangement
cycles <- 2
rdist(n = 1, perm.length = len, dist.value = len - cycles, "c") #permutation with 2 cycles</pre>
```

read.perms

Read a text file with a collection of permtuations

Description

This function reads the text file in the specified path and checks if each row is a proper permutation

Usage

```
read.perms(path)
```

Arguments

path

string with a path

Value

A collection of permutations in matrix form

Examples

```
path = system.file("test.txt", package="PerMallows")
sample = read.perms(path)
```

rgmm

Sample a Generalized Mallows Model

Description

Generate a sample of n permutations from a Generalized Mallows Model (GMM).

Usage

```
rgmm(n, sigma0, theta, dist.name = "kendall",
  sampling.method = "multistage")
```

rmm 21

Arguments

n the number of permutations to be generated

sigma0 central permuation of the GMM

theta dispersion parameter vector of the GMM

dist.name optional used name of the distance used in the GMM. One of: kendall (default),

cayley, hamming

sampling.method

optional name of the sampling algorithm. One of: multistage, gibbs (default)

Value

A matrix containing a sample of permutations from the specified ditribution

References

"Ekhine Irurozki, Borja Calvo, Jose A. Lozano (2016). PerMallows: An R Package for Mallows and Generalized Mallows Models. Journal of Statistical Software, 71(12), 1-30. doi:10.18637/jss.v071.i12"

Examples

```
\label{eq:comm} $$\operatorname{rgmm}(2,c(1,2,3,4,5),c(1,1,1,1),"\operatorname{kendall"}, "\operatorname{multistage"})$$ $$\operatorname{rgmm}(2,c(1,2,3,4,5),c(1,1,1,1),"\operatorname{cayley"}, "\operatorname{multistage"})$$ $$\operatorname{rgmm}(2,c(1,2,3,4,5),c(1,1,1,1,1),"\operatorname{hamming"}, "\operatorname{multistage"})$$ $$\operatorname{rgmm}(2,c(1,2,3,4,5),c(1,1,1,1),"\operatorname{cayley"}, "\operatorname{gibbs"})$$$ $\operatorname{rgmm}(2,c(1,2,3,4,5),c(1,1,1,1,1),"\operatorname{hamming"}, "\operatorname{gibbs"})$$
```

rmm

Sample a Mallows Model

Description

Generate a sample of n permutations from a Mallows Model (MM).

Usage

```
rmm(n, sigma0, theta, dist.name = "kendall", sampling.method = NULL,
  disk = FALSE, alert = TRUE)
```

Arguments

n the number of permutations to be generated

sigma0 central permuation of the MM dispersion parameter of the MM

dist.name optional name of the distance used in the MM. One of: kendall (default), cayley,

hamming, ulam

sampling.method

optional name of the sampling algorithm. One of: distances, multistage, gibbs

(default)

disk optional can only be true if using the Distances sampling algorithm for gener-

ating under the Ulam distance. Insted of generating the whole set of SYT and

count of permutations per distance, it loads the info from a file in the disk

alert check consistency of the parameters. TRUE by default

22 runif.permutation

Value

A matrix contaning a sample of permutations from the specified ditribution

References

"Ekhine Irurozki, Borja Calvo, Jose A. Lozano (2016). PerMallows: An R Package for Mallows and Generalized Mallows Models. Journal of Statistical Software, 71(12), 1-30. doi:10.18637/jss.v071.i12"

Examples

```
rmm(2,c(1,2,3,4,5),1,"kendall", "distances")
rmm(2,c(1,2,3,4,5),1,"cayley", "distances")
rmm(2,c(1,2,3,4,5),1,"hamming", "distances")
rmm(2,c(1,2,3,4,5),1,"ulam", "distances")

```

runif.permutation

Random permutation

Description

Generate a collection of n permutations uniformly at random

Usage

```
runif.permutation(n = 1, perm.length)
```

Arguments

n optional number of permutations to generate perm.length length of the permutations generated

Value

A single permutation or a matrix with n rows, each being a permutation. Every permutation is drawn uniformly at random and has length perm.length

```
runif.permutation(1,5)
```

swap 23

swap

Swap two items of a permutation

Description

Given a permutation and two position, swap both positions

Usage

```
swap(perm, i, j)
```

Arguments

perm	a permutation
i	position of the permutation
j	position of the permutation

Value

The permutation in the input in which the two speicfied items have been swapped

```
swap(c(1,2,3,4,5),2,5)
```
